Task 2: Working with databases

I am using a NoSQL database like MongoDb and its orm pymongo.

PyMongo is a Python distribution containing tools for working with MongoDB, and is the recommended way to work with MongoDB from Python.

The advantage of using Pymongo is that I do not need to create any predefined models those parts are handled with Pydantic if I use Fastapi. To create data it uses insert_one, for get data in use find_one for update update_one and for delete delete_one.

I have attached those screens short of the related database.
